**Figure 10.17** Example of Restoring Two's Complement Division (7/3)

# Division: Algorithm

- ▶ Assumption: divisor  $V$  and the dividend  $D$  are positive and that  $|V| < |D|$ .
- ▶ If  $|V| = |D|$ , then the quotient = 1 and the remainder = 0.
- ▶ If  $|V| > |D|$ , then  $Q = 0$  and  $R = D$ . The algorithm can be summarized as follows:
  1. Load the two's complement of the divisor into the  $M$  register; that is, the  $M$  register contains the negative of the divisor. Load the dividend into the  $A, Q$  registers. The dividend must be expressed as a  $2n$ -bit positive number. Thus, for example, the 4-bit 0111 becomes 00000111.
  2. Shift  $A, Q$  left 1 bit position.
  3. Perform  $A = A - M$ . This operation subtracts the divisor from the contents of  $A$ .
  4.
    - a. If the result is nonnegative (most significant bit of  $A = 0$ ), then set  $Q_0 = 1$
    - b. If the result is negative (most significant bit of  $A = 1$ ), then set  $Q_0 = 0$ , and restore the previous value of  $A$ .
  5. Repeat steps 2 through 4 as many times as there are bit positions in  $Q$ .
  6. The remainder is in  $A$  and the quotient is in  $Q$ .

# Division: Example

► Divide 8 by 3;     $M = -3 = 11101$ ;     $Q = 01000$

A	Q	
00000	01000	Initial values

<div> 00001  <u>11101</u>  11110 + <u>00011</u>  00001 </div>	<div> 00000  00000  00000 </div>	Shift Left Subtract Divisor(Add 2's complement of divisor) Set Q0=0 Restore    2 <sup>nd</sup> Cycle
<div> 00010  <u>11101</u>  11111+ <u>00011</u>  00010 </div>	<div> 00000  00000  00000 </div>	Shift Left Subtract Divisor(Add 2's complement of divisor) Set Q0=0 Restore    3 <sup>rd</sup> Cycle
<div> 00100  <u>11101</u>  <u>00001</u> </div>	<div> 00000  00001 </div>	Shift Left Subtract Set Q0=1    4 <sup>th</sup> cycle
<div> 00010  <u>11101</u>  11111 + <u>00011</u>  00010 </div>	<div> 00010  00010  00010 </div>	Shift left Subtract Divisor(Add 2's complement of divisor) Set Q0=0 Restore    5 <sup>th</sup> Cycle

# Division

- ▶ Consider the following examples of integer division with all possible combinations of signs of D and V:

$$D = 7 \quad V = 3 \quad \rightarrow \quad Q = 2 \quad R = 1$$

$$D = 7 \quad V = -3 \quad \rightarrow \quad Q = -2 \quad R = 1$$

$$D = -7 \quad V = 3 \quad \rightarrow \quad Q = -2 \quad R = -1$$

$$D = -7 \quad V = -3 \quad \rightarrow \quad Q = 2 \quad R = -1$$

- ▶  $(-7)/(3)$  and  $(7)/(-3)$  produce different remainders.
- ▶ The magnitudes of Q and R are unaffected by the input signs
- ▶ The signs of Q and R are easily derivable from the signs of D and V.
  - ▶  $\text{sign}(R) = \text{sign}(D)$
  - ▶  $\text{sign}(Q) = \text{sign}(D) * \text{sign}(V)$ .
- ▶ One way to do twos complement division is to convert the operands into unsigned values and, at the end, to account for the signs by complementation where needed.
- ▶ This is the method of choice for the restoring division algorithm.

# Exercise

1. Given  $x$  and  $y$  in two's complement notation i.e.,  $x=0101$  and  $y=1010$ , compute the product  $p=x*y$  with Booth's algorithm
2. Use the Booth algorithm to multiply 23 (multiplicand) by 29 (multiplier), where each number is represented using 6 bits
3. Divide 145 by 13 in binary two's complement notation, using 12-bit words. Use the restoring division algorithm
